

Claude Connectors - Notes

What connectors are, how they help, and a curated list for a Data Scientist profile.

What connectors are

Connectors let Claude link to external apps and services (e.g. Indeed, Google Drive, Slack, Gmail, calendars, GitHub) using the Model Context Protocol (MCP). This lets Claude pull real, live data and act on it directly within a conversation, instead of relying only on what's typed or pasted.

How they make life easier

- No tab-switching or copy-pasting between apps and chat
- Claude can search, fetch, and analyze real data (e.g. live job postings) in one flow
- Multi-step workflows (search, filter, analyze, report) happen in a single conversation
- Output can be turned directly into usable files (PDF, Word, etc.)
- Connectors authenticate once (typically via OAuth) and stay active across sessions

Example from today's session

- Used the Indeed connector to search and fetch live Data Scientist job postings
- Matched postings against the resume, scored fit, and flagged skill gaps
- Generated a flow diagram of the process
- Produced a one-page PDF report and LinkedIn captions from the same session

Recommended connectors for this profile

Connector	Relevance to your profile
Indeed	Live job search, resume matching, and market analysis - directly used for your job search today.
Google Drive	Pull resume, project docs, certificates, or datasets into Claude for analysis or editing.
Notion / Slite	Organize job applications, interview prep, and a learning roadmap (cloud/Docker upskilling) in one searchable workspace.
GitHub	Your portfolio (CMS Medicare, fraud detection, SQL warehouse projects) lives here - Claude can read/update repos and READMEs directly.
Slack	Useful for cross-functional/remote team collaboration - search conversations, draft updates.
Snowflake / BigQuery / Databricks	Query large datasets directly - fits your SQL/ETL/data warehouse background; useful for portfolio or future roles.
Hex	AI-assisted data analysis and notebooks - fits your XGBoost/Pandas exploratory workflow.
Microsoft 365 (Outlook, OneDrive)	Many MNCs use M365 - manage interview emails and documents (Team/Enterprise plans only).
Asana / Jira	Track your job-search pipeline or project tasks as a kanban board.

Note: Some connectors (Microsoft 365, certain enterprise integrations) require Team/Enterprise plans. Healthcare-related connectors exist but are skipped given the stated exclusion criteria. Suggested starting point: Indeed + Google Drive + GitHub, since these map most directly to active job-search and portfolio work.
